

Turn one approved issue into a governed, reviewable change.

I install a repository-native delivery path for small engineering teams already using AI coding tools. The pilot connects structured work intake, repository context, a bounded coding agent, existing quality checks, human review, and visible model usage without replacing the issue tracker or deployment pipeline.

The AI-Assisted Delivery Pilot

\$1,500 founding price · approximately 10 business days · async-first

One team. One repository. One real backlog item. The team owns the installed assets after handoff.

THE PILOT INCLUDES

- Structured issue intake; Jira or Linear as optional adapters
- Repository-specific AGENTS.md and one coding-agent adapter
- Protected paths, existing quality checks, and optional read-only AI review
- Version-controlled model config and defensible usage visibility
- Five model-change smoke cases, handoff guide, and working session

THE OPERATING PATH

Qualified issue → human marks ready → agent branch and draft PR → CI and protected-path checks → optional read-only review → human approval and normal deployment.

The agent does not approve its own work, merge, deploy, access production credentials, or silently widen the issue.

Best fit

- Owner-led software companies, consultancies, or product teams with roughly 5–25 engineers
- Teams using Claude Code, Codex, Cursor, Copilot, or another coding agent
- Variable output quality, growing review churn, or missing shared repository rules
- A technical owner ready to approve and review one real pilot issue

Not a fit

- Enterprise-wide transformation, replacement CI/CD, autonomous production deployment, or open-ended embedded support
- Investment management, wealth advisory, retirement solutions, ESG data, credit ratings, or financial-services compliance software

Selected enterprise experience

Outcomes from full-time engineering roles, not consulting clients.

- Broader AI-adoption and delivery-hardening initiative associated with 42% fewer defects and approximately 20% shorter cycle time
- Approximately 90% less processing volume/time and 35% better throughput/latency
- 600K+ events/day; 450K+ vehicles; work associated with approximately \$5M annual savings
- Secure AWS delivery onboarding 23+ enterprise recordkeepers

Start with one repository and one real issue.

Repository access stays minimal. Production credentials are not accepted. Client source and installed assets stay private. Calls are recorded for notes by default; clients can opt out before the session.
